

Writeup for mAadhar Application

Algorithm

Problem statement:

Develop an application to automate the process of applying for an Aadhar Card by making it smoother for Indian citizens.

Scenario:

Varniraj Service PVT. LTD is closely working with “The Government of India” to help them get a solution for processing applications for Aadhaar Card. Application is intended to register citizens and let them display ID to process their Aadhar Card application.

Expected Deliverables:

Features of the application:

- Registration
- Login
- Apply for a new Aadhar Card
- Place a request for updating Aadhar details
- Apply for a duplicate Aadhar Card
- Admin: Approve Aadhar Application and issue new Aadhar number
- Apply to close Aadhaar card (due to death)

Recommended technologies:

- **Database:** MySQL
- **Backend:** Java Programming (Spring Boot, JPA, Hibernate)
- **Frontend:** Angular, Bootstrap, and HTML/CSS
- **Automation and testing technologies:** Selenium and TestNG
- **DevOps tools/technologies:** Git, GitHub, Jenkins, and Docker
- **Optional implementation:** Kubernetes, AWS

Project development guidelines:

- The project will be delivered within four sprints with every sprint delivering a Minimal Viable Product.
- It is mandatory to perform proper sprint planning with user stories to develop all project components.
- The learner should use the above-mentioned technologies for different layers of the project.
- The web application should be responsive and should fetch or send data dynamically without hard-coded values.
- The learner must maintain the version of the application over GitHub, and every new change should be sent to the repository.
- The learner must implement a CI/CD pipeline using Jenkins.
- The learner should also deploy and host the application on an AWS EC2 instance.
- The learner should also implement automation testing before the application enters the CI/CD pipeline.
- The learner should use Git branching to perform basic automation testing of the application in it separately.
- The learner should make a rich frontend of the application, which is user-friendly and easy for the user to navigate through the application.
- There will be two portals in the application, the admin and user portal.

Admin Portal:

The admin portal deals with all the backend data generation. The admin user should be able to:

- Login through admin credentials
- Approve new Aadhaar Card request
- Verify request for duplicate Aadhaar
- Display all issued Aadhaar Card
- Delete Aadhaar card details for dead citizen

User Portal:

It deals with user activities. The end-user should be able to:

- Sign in to apply for a new Aadhar Card
- Login to see the Aadhar number assigned by the admin
- Update address, phone number, and date of birth of Aadhaar Card
- Request duplicate Aadhaar Card

Frontend Validation:

- For admin: The password should have at least: One Uppercase, one lowercase, one special character (@,#,&....), and one number.
- For citizens: The password should consist of only digits.

Backend Validation:

- Mobile number validation should be applied.
- Password length should not be less than 6 characters.
- For citizens: The home page would authenticate only if the mobile number provided in Aadhaar is matching with the password.

Sample Input data for Backend REST API:

- To register new citizens:

HTTP Method: POST

URL: <http://localhost:6789/AadharApp/citizens>

Request Body:

```
{  
  "name": "Uttam Patel",  
  "dob": "2011-08-23",  
  "address": "2/5 Heerabagh Flats",  
  "emailId": "uttampatel0811@gmail.com",  
  "mobileNo": "7976694711",  
  "gender": "Male"  
}
```

- Apply for Aadhar Card using an existing citizen ID:

HTTP Method: POST

URL: <http://localhost:6789/AadharApp/issueAadhar>

RequestBody:

```
{  
  "citizenId": 1002,  
  "passportId": null,  
  "issueDate": "2020-04-25"  
}
```
